## TRANSFORMATIONS CHEAT-SHEET!

## REFLECTIONS:

$\checkmark$ Reflections are a flip.
$\checkmark$ The flip is performed over the "line of reflection." Lines of symmetry are examples of lines of reflection.
$\checkmark$ Reflections are isometric, but do not preserve orientation.

## Coordinate plane rules:

| Over the $x$-axis: | $(x, y) \rightarrow(x,-y)$ |
| :--- | :--- |
| Over the $y$-axis: | $(x, y) \rightarrow(-x, y)$ |
| Over the line $y=x:$ | $(x, y) \rightarrow(y, x)$ |
| Through the origin: | $(x, y) \rightarrow(-x,-y)$ |

## TRANSLATIONS:

$\checkmark$ Translations are a slide or shift.
$\checkmark$ Translations can be achieved by performing two composite reflections over parallel lines.
$\checkmark$ Translations are isometric, and preserve orientation.

## Coordinate plane rules:

$(x, y) \rightarrow(x \pm h, y \pm k)$ where $h$ and $k$ are the horizontal and vertical shifts.
Note: If movement is left, then $h$ is negative. If movement is down, then $k$ is negative.

## DILATIONS:

$\checkmark$ Dilations are an enlargement / shrinking.
$\checkmark$ Dilations multiply the distance from the point of projection (point of dilation) by the scale factor.
$\checkmark$ Dilations are not isometric, and preserve orientation only if the scale factor is positive.

## Coordinate plane rules:

From the origin dilated by a factor of "c": $(x, y) \rightarrow(c x, c y)$
From non-origin by factor of " $c$ ": count slope from point to projection point, multiply by "c," count from projection point.

## ROTATIONS:

$\checkmark \quad$ Rotations are a turn.
$\checkmark$ Rotations can be achieved by performing two composite reflections over intersecting lines. The resulting rotation will be double the amount of the angle formed by the intersecting lines.
$\checkmark$ Rotations are isometric, and do not preserve orientation unless the rotation is $360^{\circ}$ or exhibit rotational symmetry back onto itself.
$\checkmark$ Rotations of $180^{\circ}$ are equivalent to a reflection through the origin.
Coordinate plane rules:

| Counter-clockwise: | Clockwise: | Rule: |
| :--- | :--- | :--- |
| $90^{\circ}$ | $270^{\circ}$ | $(x, y) \rightarrow(-y, x)$ |
| $180^{\circ}$ | $180^{\circ}$ | $(x, y) \rightarrow(-x,-y)$ |
| $270^{\circ}$ | $90^{\circ}$ | $(x, y) \rightarrow(y,-x)$ |
